As a frequently used technique in agriculture, genetic selection and breeding of plants and animals have been practiced since ancient times. However, the development of modern genetic engineering techniques has opened up new possibilities for genetic selection and breeding. In this paper, we will discuss the application of genetic engineering in agriculture, focusing on the selection and breeding of crops and livestock. We will first introduce the basic principles of genetic engineering, then discuss its application in crop and livestock breeding, and finally, we will discuss the challenges and prospects of genetic engineering in agriculture.
